Find EZproxy Hosted External IP Address

External IP address for Hosted members

Applies to

- All EZproxy Versions

Answer

- If you know your server name such as oclc.idm.oclc.org, you can do a nslookup command from a command prompt and get the IP address. At a command prompt, you type in:

```bash	nslookup [server code].idm.oclc.org
```

in this case, it would be:

```bash	nslookup oclc.idm.oclc.org
```

- You will get the IP address in the response.
- Or for Hosted EZproxy contact OCLC Support.
- Or for a Standalone EZproxy. You will have to contact your IT as they will know what IP is assigned to your server.
