Access-Control-Allow-Origin CORS error

Last updated: Wed, 19 Jan 2022 20:29:20 GMT

Symptom

- Getting a CORS error when using Access-Control-Allow-Origin

Applies to

- EZproxy

Resolution

The Access-Control-Allow-Origin header should contain a list of origins that are "allowed" to access the resource. Here is what you can do to fix the issue:

1. If you are getting a CORS error, then you should use an anonymous site that will use the asterisk.
2. Sending back a header of Access-Control-Allow-Origin: * would allow all sites to access the requested resource.
